(Trigonometry- Equations)

Name:

- 1. Suppose that $\tan \alpha = \frac{3}{4}$ and α lies in quadrant III. Find the other trigonometric ratios for α . Draw the angle α . (2 points)
- 2. In a right-angled triangle the length of a leg is twice the other. Calculate the trigonometric ratios of the smallest angle. (1.75 points)
- 3. A woodcutter wants to determine the height of a tall tree. He stands at some distance from the tree and determines that the angle of elevation to the top of the tree is 40° . He moves 30 metres closer to the tree, and now the angle of elevation is 50° . If the woodcutter's eyes are 1.5m above the ground, how tall is the tree? (2 points)
- 4. In an isosceles triangle, the base is 12 metres long and the congruent angles are 70° each. Find the length of the other sides and the area. (2 points)
- 5. Solve: a) $x + \sqrt{3x + 10} = 6$

(2.25 points)

b)
$$x + \frac{1}{x} = \frac{4}{\sqrt{3}}$$

c)
$$(2x^4-3x^2-20)(3x-2)=0$$

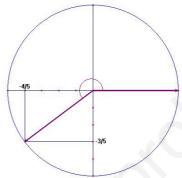

SOLUTION

1. Suppose that $\tan \alpha = \frac{3}{4}$ and α lies in quadrant III. Find the other trigonometric ratios for α . Draw the angle α .

$$1 + tan^{2} \alpha = \frac{1}{cos^{2} \alpha} \rightarrow 1 + \left(\frac{3}{4}\right)^{2} = \frac{1}{cos^{2} \alpha} \rightarrow \frac{25}{16} = \frac{1}{cos^{2} \alpha} \rightarrow cos^{2} \alpha = \frac{16}{25}$$

$$\cos \alpha = \pm \sqrt{\frac{16}{25}} \rightarrow \cos \alpha = -\frac{4}{5} \rightarrow \tan \alpha = \frac{\sin \alpha}{\cos \alpha} \rightarrow \sin \alpha = \tan \alpha \cdot \cos \alpha$$

$$\sin\alpha = \frac{3}{4} \cdot -\frac{4}{5} = -\frac{3}{5}$$

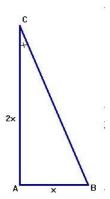

2. In a right-angled triangle the length of a leg is twice the other. Calculate the trigonometric ratios of the smallest angle. $h^2 = x^2 + (2x)^2 = 5x^2 \rightarrow h = \sqrt{5}x$

$$\sin \alpha = \frac{x}{\sqrt{5}x} = \frac{1}{\sqrt{5}} = \frac{\sqrt{5}}{5}$$

$$\cos \alpha = \frac{2x}{\sqrt{5}x} = \frac{2}{\sqrt{5}} = \frac{2\sqrt{5}}{5}$$

$$\tan \alpha = \frac{x}{2x} = \frac{1}{2}$$

- 3. A woodcutter wants to determine the height of a tall tree. He stands at some distance from the tree and determines that the angle of elevation to the top of the tree is 40° . He moves 30 metres closer to the tree, and now the angle of
- elevation is 50°. If the woodcutter's eyes are 1.5m above the ground, how tall is the tree?

$$tan 40 = \frac{y}{x + 30} \bigg| y = (x + 30)tan 40 \bigg|$$

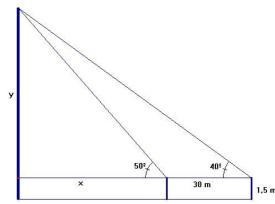

$$tan 50 = \frac{y}{x} \bigg| y = x tan 50 \bigg|$$

$$x tan 40 + 30 tan 40 = x tan 50$$

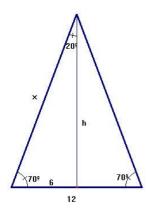

$$x(tan 50 - tan 40) = 30 tan 40$$

$$x = 71.38m \rightarrow y = 71.38 \cdot tan 50 = 85.07m$$

The tree is 85.07+1.5=86.57 metres tall

4. In an isosceles triangle, the base is 12 metres long and the congruent angles are 70° each. Find the length of the other sides and the area.

$$\cos 70 = \frac{6}{x} \Rightarrow x = \frac{6}{\cos 70} = 17.54 \text{ m}$$

The other sides are 17.54 metres long

$$tan 70 = \frac{h}{6} \Rightarrow h = 6 tan 70 = 16.48 \text{ m}$$

Area: $A = \frac{12 \cdot 16.48}{2} = 98.9 \text{ m}^2$

Area:
$$A = \frac{12 \cdot 16.48}{2} = 98.9 \,\mathrm{m}^2$$

5. Solve:

a)
$$x + \sqrt{3x + 10} = 6 \rightarrow \sqrt{3x + 10} = 6 - x \Rightarrow 3x + 10 = 36 - 12x + x^2$$

$$x^2 - 15x + 26 = 0 \rightarrow x = \frac{15 \pm \sqrt{121}}{2} = \begin{pmatrix} 13 \\ 2 \end{pmatrix}$$

Checking:
$$x = 13 \to \sqrt{39 + 10} = 6 - 13 \Rightarrow 7 = -7 \text{ NO}$$

 $x = 2 \to \sqrt{6 + 10} = 6 - 4 \Rightarrow 4 = 4 \text{ YES}$
Sol: $x = 2$

b)
$$x + \frac{1}{x} = \frac{4}{\sqrt{3}} \rightarrow \sqrt{3}x^2 + \sqrt{3} = 4x \rightarrow \sqrt{3}x^2 - 4x + \sqrt{3} = 0$$

$$x = \frac{4 \pm \sqrt{16 - 4\sqrt{3}\sqrt{3}}}{2\sqrt{3}} = \frac{4 \pm 2}{2\sqrt{3}} \begin{cases} \frac{6}{2\sqrt{3}} = \frac{3}{\sqrt{3}} = \sqrt{3} \\ \frac{2}{2\sqrt{3}} = \frac{1}{\sqrt{3}} = \frac{\sqrt{3}}{3} \end{cases}$$

c)
$$(2x^4 - 3x^2 - 20)(3x - 12) = 0 \rightarrow \begin{cases} 2x^4 - 3x^2 - 20 = 0 \rightarrow (*) \\ 3x - 12 = 0 \rightarrow x = 4 \end{cases}$$

$$(*)2x^4 - 3x^2 - 20 = 0, z = x^2 \rightarrow 2z^2 - 3z - 20 = 0 \rightarrow z = \frac{3 \pm \sqrt{169}}{4} = \begin{pmatrix} 4 \\ -\frac{5}{2} \end{pmatrix}$$

$$x^{2} = z = \begin{cases} 4 \rightarrow x = \pm\sqrt{4} = \pm2\\ -\frac{5}{2} \rightarrow x = \pm\sqrt{-\frac{5}{2}} \text{ NO} \end{cases}$$
 Solution: $x = 4$, $x = 2$, $x = -2$
